AI Interaction 2 Log

Group No.:	Version Before Revision:	AI Tool(s):	Date:
9	Prototype 1	Cursor (Grok); AI coding agent for Revision 3	2026-11-09, 2026-11-10

Prototype 1 was copied to Group9_Final_Calculator.html and was not overwritten. Each round below is one accepted change. The prompts are the key instructions given to the tool. The test results were checked in the browser after the page was built.

Key AI-Assisted Revision 1

Issue and Intended Improvement	Prototype 1 multiplies weekly and monthly activities by a fixed 18 weeks and 4.5 months. Li Ming cannot see that this length is an assumption, and he cannot try another semester length. High-speed rail and clothing are already per semester and should not be scaled again.
Exact Key Prompt(s)	From Prototype 1, add an editable field “Weeks in a teaching semester”, default 18. Multiply weekly activities by this number. Convert monthly activities with 1 month = 4 weeks, so months in the semester equal weeks divided by 4. Electricity days equal weeks times 7. Do not multiply high-speed rail or clothing. Label the semester length as an assumption, not a shared-profile fact. Reset restores 18 weeks and Li Ming’s defaults.
Group Decision and Revision	Accepted. The field was added on the energy step of Group9_Final_Calculator.html. The note states the assumption, the month rule, and that high-speed rail and clothing stay per semester.
Test Result or Remaining Issue	With the default 18 weeks, the reported total is 783.7 kg. Metro is 540.0 km/semester and high-speed rail is 880.0 km/semester. After the weeks field is changed to 16, the reported total falls to 699.3 kg, metro falls to 480.0 km, beef or lamb falls from 54.0 to 48.0 meals, and electricity is scaled to 112 days. High-speed rail stays 880.0 km. Reset returns the weeks field to 18 and the total to 783.7 kg.

Key AI-Assisted Revision 2

Issue and Intended Improvement	Prototype 1 labels the headline kg CO_2e, but electricity and high-speed rail are sourced kg CO_2, while food and the other city modes are unverified kg CO_2e. Beef or lamb is about 324 kg under the default profile, so food suggestions look like a verified ranking even though the profile gives no meal weight. The ride-hailing suggestion also used the wrong unit.
Exact Key Prompt(s)	Change the results headline so it is a mixed reported total, not a complete CO_2e figure. Show sourced kg CO_2 for electricity and high-speed rail separately from unverified kg CO_2e for the other quantified activities. If a reduction suggestion uses an unverified per-meal factor, say the comparison is illustrative because the profile gives no meal weight. State the ride-hailing factor as 0.20 kg/km, not kg per passenger-kilometre. Do not invent a meal weight, and do not add showers, parcels, clothing, or waste to the total.
Group Decision and Revision	Accepted. The headline now reads “kg reported / teaching semester”. Sourced CO_2 and unverified CO_2e are listed separately. Food and unverified transport suggestions say the comparison is illustrative. The electricity suggestion stays in kg CO_2. Shared-profile defaults were not changed.

Test Result or Remaining Issue	At the default 18 weeks, the results page shows 783.7 kg reported / teaching semester. It then states: sourced kg CO_2 is electricity 72.3 kg and high-speed rail 23.8 kg, together 96.1 kg; unverified kg CO_2e for the other quantified activities is 687.6 kg. The beef suggestion says the comparison uses unverified per-meal factors and is illustrative. The electricity suggestion uses kg CO_2 and does not use that caveat. Showers, parcels, clothing, and waste remain outside the total.

Key AI-Assisted Revision 3

Post-review, 2026-11-10

Issue and Intended Improvement	Revision 2 left the meal factor as a figure per meal and stated that the profile gives no meal weight. That left the largest block of the result, 648 kg or 83 per cent of the total, on a unit no published factor uses, and it could not be improved without stating a weight. The page was also long and dark to read on a projector.
Exact Key Prompt(s)	Rebuild the food rows as meals per week × a portion in grams × a factor per kilogram of food. Make the portion an editable input, default 100 / 250 / 400 / 400 g, so the default result stays 783.7 kg. Label the portions as assumptions and update the factor table to per-kilogram units. Then restyle the page on the same palette as the slides, shorten the copy, add an icon per step, and let each category on the results page jump back to its step.
Group Decision and Revision	Accepted. The food model is portion-based; the portion is labelled an assumption and is not a profile fact. The factor table now gives per-kilogram factors marked provisional. The page was restyled, the copy shortened, and an Edit link added per category. Nothing was added to the boundary: no new category, no new factor.
Test Result or Remaining Issue	2026-11-10: default total 783.7 kg, food 648.0 kg, food mass 113.4 kg. Beef suggestion −159.3 kg to 624.4 kg; other meat −90.0 kg to 693.7 kg; electricity unchanged at −14.5 kg to 769.3 kg. Raising the beef portion to 200 g moves food to 972.0 kg, as expected. Remaining issue: the per-kilogram factors are still provisional, and food, metro, and ride-hailing still have no published source — the same disclosure as before, now stated per kilogram.
