AI-aided Revision and Decision Log

Revisit 1. Record how your group translated the approved revision brief into Prototype 1.0. Include only interactions that influenced a decision; do not paste the HTML code or the full chat.

Group: 9	Date: 25 October 2026	AI tool: Cursor (Grok)		

1 Record the revision process

Give AI the approved revision brief. Ask it to confirm the requested calculator changes before editing, then record how your group reviewed the result.

Stage and purpose	Exact prompt or follow up	Relevant AI response or implemented change	Group review and decision
1 CONFIRM Purpose: Ask AI to restate the requested calculator changes so that your group can check whether it has understood your decisions correctly. Do not ask AI to modify the code yet.	Before editing, restate only these calculator changes: 1. Replace the electricity factor with 0.5737 kg CO2/kWh and cite the 2023 Shanghai provincial factor. 2. Replace the high-speed rail factor with 0.02709 kg CO2/passenger-km and cite Tong et al. 2025. 3. Separate sourced factors from factors that are not yet verified, and state that the two sourced factors are CO2, so the semester total is not a complete CO2e figure. Do not change shared defaults, excluded activities, the 18-week conversion, or the 4-person split.	Cursor restated those three changes and did not edit the calculator. It estimated that Li Ming's default total would move from 785.8 kg to about 783.9 kg per teaching semester.	Accept. The group approved the restated plan. The two replacements match the activity units. The beef factor stays unverified because the profile gives no meal weight.
2 IMPLEMENT Purpose: Correct or approve the plan, then request one complete HTML file with only the approved changes.	Approved. Implement only the restated changes in one HTML file.	Created Group9_Prototype1.html from Group9_Prototype0.html. The electricity factor is 0.5737 kg CO2/kWh. The high-speed rail factor is 0.02709 kg CO2/passenger-km. The factor table has status and source columns. The total and the notes state the CO2 limitation. Shared defaults, exclusions, time assumptions, and the 4-person split are unchanged. The page is labeled Prototype 1.	Accept. The file contains the approved changes. It does not add a shower proxy, a meal-weight proxy, or new activity inputs.
3 REVIEW Purpose: Record one important correction, follow-up or confirmation after checking Prototype 1.0.	Check Li Ming's default result in Prototype 1 against the approved factors.	With Li Ming's defaults, Prototype 1 shows 783.7 kg for the teaching semester. His electricity share is 72.3 kg. High-speed rail is 23.8 kg. Transport is 63.4 kg. Food remains 648.0 kg. The earlier estimate of about 783.9 kg was before one-decimal rounding. The approved factor values were not changed again.	Accept. No further code change. The displayed total is the approved calculation, rounded to one decimal place.

2 Summarize the development from Prototype 0 to Prototype 1.0

Describe how Prototype 1.0 differs from Prototype 0, including the changes made, the features retained, and any issues that remain unresolved.

Changes from Prototype 0 What changed in Prototype 1.0, and why?	Electricity changed from 0.57 kg CO2e/kWh to 0.5737 kg CO2/kWh, using the 2023 Shanghai provincial grid factor for a dorm in Shanghai. High-speed rail changed from 0.03 kg CO2e/passenger-km to 0.02709 kg CO2/passenger-km, using the 2019 China operation-phase factor. The factor table now shows status and source. The result states that these two sources report CO2. The submitted file is Group9_Prototype1.html.
Features retained What was reviewed and retained in Prototype 1.0?	The five-step wizard, sticky total, dashboard, category chart, and reset to Li Ming's defaults. Original time units, the 18-week semester, the 4.5-month conversion, and the equal split of room electricity among 4 people. Exclusion of showers, shopping, waste, and takeaway packaging. The unverified factors for walking, metro, ride-hailing, and the four meal types.
Remaining issues or limitations What remains uncertain or unresolved?	Metro, ride-hailing, walking, and all meal factors still have no source adopted here. The semester total mixes CO2 factors with unverified CO2e factors, so it is not a complete CO2e inventory. Shower energy, product data, and waste mass are still missing, so those activities stay outside the total. Eighteen weeks per semester remains an assumption.
