Instructions for a Demo Presentation

Carbon Accounting (Global College）SDG 2410J

Purpose

Use a short, clear and user-focused demonstration to present your final personal carbon footprint calculator. Help the audience understand:

- what the client needs are;
- how the calculator was designed to respond to those needs;
- what strengths and value the final product offers;
- what your group learned while reviewing and improving it.

This is a demo presentation, not a complete report of everything your group has done.

Presentation Format

Maximum time	8 minutes per group
Presentation order	Selected randomly in class
Slides	Upload to Canvas before the stated deadline
Participation	Show shared group ownership; do not leave the entire presentation to one member
Calculator version	Use your final submitted version

Because of the strict time limit, organize the presentation around three parts:

1. Introduction

2. Calculator Demo

3. Reflection

Aim to finish the planned content within approximately 7 minutes and 30 seconds, leaving time for transitions between speakers, slides and the calculator webpage.

For more comprehensive advice, refer to *How to Give a Demo Presentation* at https://courses.cs.washington.edu/courses/cse403/26wi/project/demo.html, which is from the University of Washington's course CSE 403 Software Engineering.

1 Introduce the Project

Suggested time: 1 minute

State the most important client needs identified by your group. Then explain briefly how your calculator responds to them and why this response is valuable to Li Ming or students with similar lifestyles.

Keep the introduction to two main points:

- the client needs your group focused on;
- the value your calculator provides in response.

Do not repeat the full project brief, describe the development process or list every function.

2 Demonstrate the Calculator

About 5 minutes

The demonstration should take up most of the presentation.

Show a short and realistic user journey through the calculator. Highlight the functions and results that best demonstrate how your product responds to the client needs identified by your group.

During the demonstration:

- guide the audience through the most relevant parts of the user experience;
- explain how the selected functions respond to the client's needs;
- highlight the product strengths that you want the audience to remember;
- show how the calculator turns activity information into results that the user can understand and use.

Different groups may focus on different client needs and develop different product strengths. Demonstrate what is distinctive and valuable about your final calculator rather than trying to show every function.

Do not spend most of the time entering data, explaining every emission factor or presenting detailed code.

Plan and rehearse a short demonstration route.

3 Share Your Reflection

About 1 to 2 minutes

Use one concrete example to explain how your group reviewed and improved the calculator.

Briefly describe:

- an important issue identified during the product check;
- the revision made in response and the reason for it;
- how the revision strengthened the product or improved its value to the client;
- a remaining limitation or a lesson your group learned.

Avoid general statements about teamwork or simply saying that the calculator was improved. Connect the issue, the revision and its effect clearly.

End with one concise statement about the main value or strength that you want the audience to remember.

Practical Preparation

- Upload the slides to Canvas before the deadline.
- Rehearse the complete presentation with a timer.
- Practise switching smoothly between the slides and calculator webpage.
- Practise transitions between group members.
- The presentation will use the classroom computer. Use standard file and image formats, and avoid unusual fonts, embedded media or special formats that may not display correctly.

Keep the presentation focused on the connection between **client needs, product strengths, demonstrated value and evidence-based improvement**.
